- d. creating a management record pointer instance and executing functions and filter associated with the management record pointer instance, if the primary record type is a lead primary record;
- e. if the primary record type is not a lead primary record, reading the management record pointer instance for the management record pointer family;
- f. determining whether a field related to the primary record instance is a management record pointer instance; and
- g. adding a primary record instance pointer to the management record pointer instance.
- 32. The method of claim 29, wherein the step of executing the management record functions comprises the steps of:
  - retrieving the changed primary record instance and its corresponding primary record type;
  - b. retrieving the function that uses the changed primary record instance;
  - c. retrieving the management record pointer family of the function that uses the changed primary record instance;
  - d. retrieving the management record pointer instance for the changed primary record instance;
  - e. executing the function; and
  - f. executing functions using the management record pointer instance.
- 33. The method of claim 29, wherein the substep of updating the dynamic documents comprises the steps of:
  - a. identifying changed management record pointer instances and changed primary record instances;
  - b. identifying the dynamic document pointers instances that use the changed fields;

- determining whether any of the changed fields, pointers and filters are used in other
  nested calculations, and identifying the dynamic document pointer instances that use the
  other nested calculations;
- d. executing the filters for the identified dynamic document pointers, each filter execution corresponding to a data selection according to a set of data selection criteria;
- e. executing the functions for the identified dynamic document pointers;
- f. re-sorting the records of dynamic document pointers; and
- g. re-displaying the records of dynamic document pointers.
- 34. The method of claim 2, wherein the step of writing an XML document for the dynamic document instance when any of its dynamic document pointer records change:
  - a. identifying the changed primary record instances;
  - b. identifying the dynamic documents pointer records that include changed primary record instances;
  - c. updating the the dynamic documents pointer records affected by the primary record instance changes;
  - d. retrieving the dynamic document definition to XML document type definition maps;
  - e. creating the XML document by copying dynamic document instance data values into the record components;
  - f. copying standard XML document header information and tags into the XML document; and
  - g. handing the XML document and the destination Internet address to a web server.
- 35. The method of claim 1, wherein multiple individuals can view and maintain the identical MRI through multiple dynamic documents concurrently.
